

Stealth Fighter Jet: Defined Design

The design of the stealth fighter jet very clearly demonstrates all the characteristics of a good design by it being complicated enough to be intriguing to a target audience but simple enough to be understood while also having its form follow its function.

“Good design is complicated enough to be intriguing to a target audience but simple enough to be understood. Form follows function.”

From the simplistic looking design to its more than practical purpose the stealth fighter jet is a well made design all around. The stealth fighter is used in bombing missions where the key to victory is fire power, speed and surprise. Because of its flat and sharp angles used in its covering panels it is extremely hard to detect on radars and is often not noticed until it is too late meaning it is very functional.

The unique design of the stealth fighter is meant to minimize detectability by using sharp angles, flat surfaces, radar absorbent material and of coarse black paint. the shape is very aerodynamic and allows it to be very fast and agile.
