

LINEAR MODELLING

Example 1 ~ Car Value Model

The average price of a used Camero Z28 depends on the age of the car. Suppose a 2 yr old Camero costs \$32,350 and a 5 yr old costs \$26,875. Assume a linear relationship can be used to model the situation.

a) Find the equation that describes this relationship.

$$2 \text{yr} \rightarrow \$32,350$$

$$5 \text{yr} \rightarrow \$26,875$$

$$(x, y) \\ (2, 32,350)$$

$$(5, 26,875)$$

The cost depends on the age (x)

Find the slope:

$$m = \frac{\Delta y}{\Delta x}$$

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

$$m = \frac{26,875 - 32,350}{5 - 2}$$

$$m = \frac{-\$5472}{3 \text{yr}}$$

Let x be the age
y be the cost
(DEFINE THE
VARIABLES)

Significance of
slope ...
every year the cost
decreases (-) by \$1825

$$m = -\$1825/\text{yr}$$

Find the y-intercept:

Write equation:

$$y = mx + b$$

$$y = -1825x + b$$

$$26,875 = -1825(5) + b$$

$$26,875 = -9125 + b$$

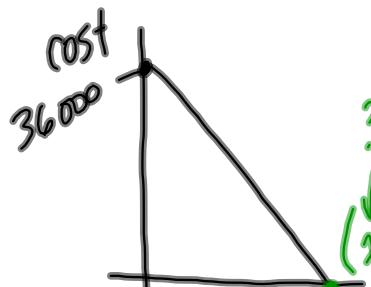

$$26,875 + 9125 = b$$

Significance of
y-intercept

$$b = \$36,000$$

is that it represents the cost of the car when

b) Determine the x - and y -intercepts and explain their meaning in the context of the situation.

From the last question we found
the y -intercept to be \$36,000 and
this is the cost of the car when it was
brand new

To find the x -intercept, let $y = 0$

$$y = -1825x + 36000$$

$$0 = -1825x + 36000$$

$$\frac{-36000}{-1825} = \frac{-1825x}{-1825}$$

$$x = 19.7 \text{ yr}$$

In 19.7 yrs
the cost of the
car will be zero

c) How much would a $\overset{x}{7}$ yr old Camaro cost?

$$y = -1825x + 36000$$

$$y = -1825(7) + 36000$$

$$y = \$23,225$$

Example 2 ~ Bridge Problem

A bridge is constructed of steel so that it has gaps of 1.3 cm when the outside temperature is 22°C. The steel will contract by 0.05 cm for each 1°C drop in temperature. y x y
 tells us the slope

The width of the gap depends on the temperature.
y x

Let x be the temperature (°C) (22, 1.3)

y be the width of the gap (cm)

$$m = \frac{0.05 \text{ cm}}{-1^\circ\text{C}} = -0.05$$

- a) Find the equation that relates
gap width to temperature

$$y = mx + b$$

$$1.3 = -0.05(22) + b$$

$$1.3 = -1.1 + b$$

$$\begin{cases} 2.4 = b \\ \text{cm} \end{cases}$$

$$\boxed{y = -0.05x + 2.4}$$

y x

- b) At what temperature would the gap close completely? (i.e. $y=0$)

$$y = -0.05x + 2.4$$

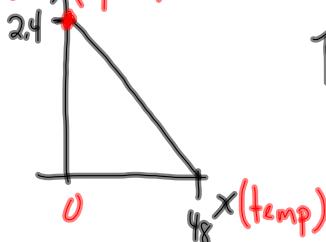

$$0 = -0.05x + 2.4$$

$$\frac{-2.4}{-0.05} = \frac{-0.05x}{-0.05}$$

$$\boxed{x = 48^\circ\text{C}}$$

- c) What is the significance of the y -intercept?

(gap) $(0, 2.4)$

The y -intercept represents
the gap width at 0°C .
