

WEIGHT

A body of mass 2.00 kg is at the surface of the Earth where the gravitational field strength is 9.81 N kg⁻¹.

a) What is the body's weight?

$$19.6 \text{ N}$$

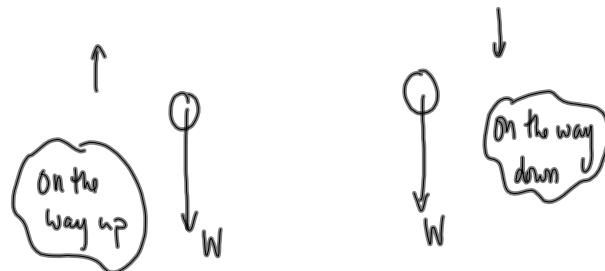

b) If its weight on the surface of the moon is 3.30 N, what is the strength of the Moon's gravity at its surface?

$$1.65 \text{ N kg}^{-1}$$

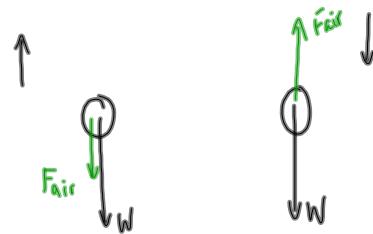

$$W = mg \leftarrow 9.81 \text{ N kg}^{-1}$$

Free-Body Diagrams (FBDs)

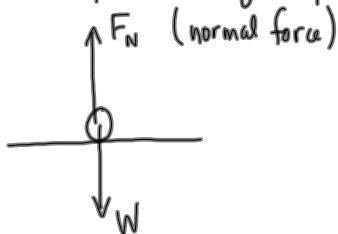

Consider throwing a ball up in the air. Draw a FBD for the ball on the way up and on the way back down.
(no air resistance)

If there were air resistance:

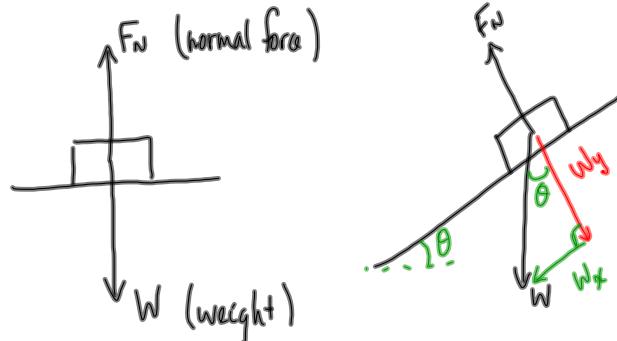

Consider that you are sitting in your chair:

When you draw a FBD:

- identify the forces acting on the body
- represent each force with an arrow pointing in the direction of the force
- draw arrows so that they start at the centre of the body (i.e. all tails in the centre)
- make arrows proportional to size of force
- label forces

The "normal" force means \perp
 It is a force that is perpendicular to the surface. It is
 the force of the surface pushing on an object.

F_N is equal in
magnitude
to W

$$F_N \perp W$$

Draw a FBD for:

- ① apple on horizontal ground
- ② a trolley being pulled along against friction on a horizontal surface.
- ③ a book at rest on an inclined plane
- ④ a bob on a pendulum at the extent of its swing.
