

3.2 Remainder Theorem

$$\frac{x^3}{x} \rightarrow x^2$$

ex) Divide $x^3 + 2x^2 - 5x - 6$ by $x + 2$.

$$\begin{array}{r}
 -2 \quad \boxed{\begin{array}{r} 1 \ 2 \ -5 \ -6 \\ \downarrow -2 \ 0 \ 10 \\ 1 \ 0 \ -5 \ \textcircled{4} \end{array}}
 \end{array}$$

$$x^2 - 5 \quad R=4$$

Try subbing $x = -2$ into $P(x)$.

$$\begin{aligned}
 (-2)^3 + 2(-2)^2 - 5(-2) - 6 &= 4 \\
 -8 + 8 + 10 - 6 &= 4
 \end{aligned}$$

Try subbing $x = 2$ into $P(x)$.

$$(2)^3 + 2(2)^2 - 5(2) - 6 = 0$$

This means $P(x) \div (x-2)$ has a remainder of 0.

$$\begin{array}{r}
 2 \quad \boxed{\begin{array}{r} 1 \ 2 \ -5 \ -6 \\ \downarrow 2 \ 8 \ 6 \\ 1 \ 4 \ 3 \ 0 \end{array}}
 \end{array}$$

$$(x-2) \quad (x^2 + 4x + 3)$$

$$(x-2)(x+3)(x+1)$$

Remainder Theorem

When $P(x)$ is divided by $x-a$, the remainder is $P(a)$.

ex) What's the remainder of $\frac{x^3 - 10x + 6}{x + 4}$?

$$\begin{array}{r}
 -4 \quad \boxed{\begin{array}{r} 1 \quad 0 \quad -10 \quad 6 \\ \downarrow -4 \quad 16 \quad -24 \\ 1 \quad -4 \quad 6 \quad -18 \end{array}}
 \end{array}$$

$$(-4)^3 - 10(-4) + 6 = -18$$
